Hello user this is PirateOS user manual.

WiFi setup

this is NetworkManager applet. You will use it to connect to the internet or setup VPN connection.
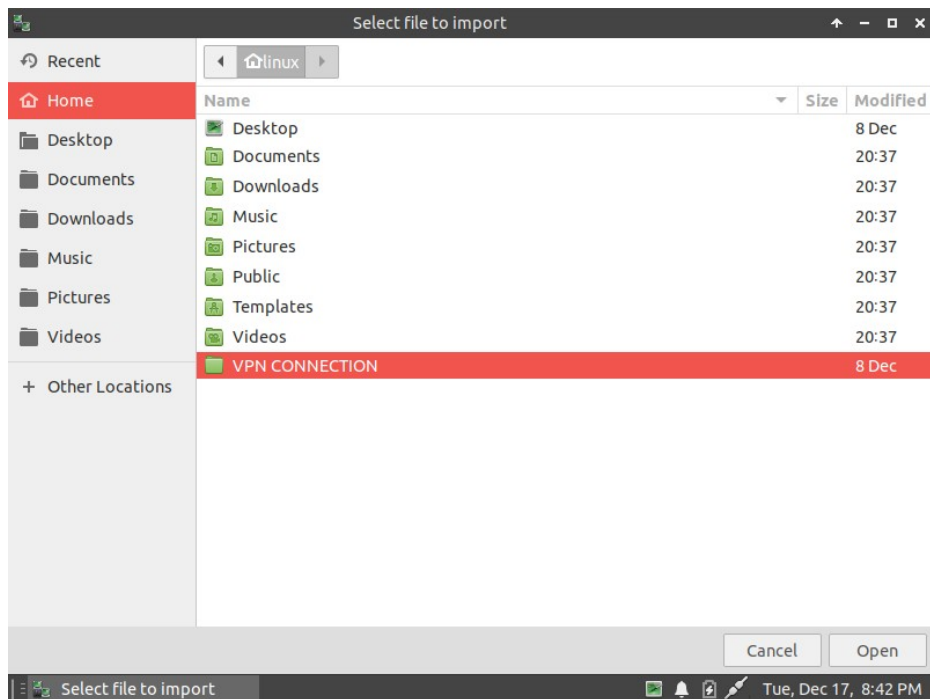

First you have to press it :)
If you don't see any wifi networks, that means pirateOs doesn't have drivers for your network device. Please inform developer about that problem. You can always use ethernet cable to connect to the internet and to use your wallet.
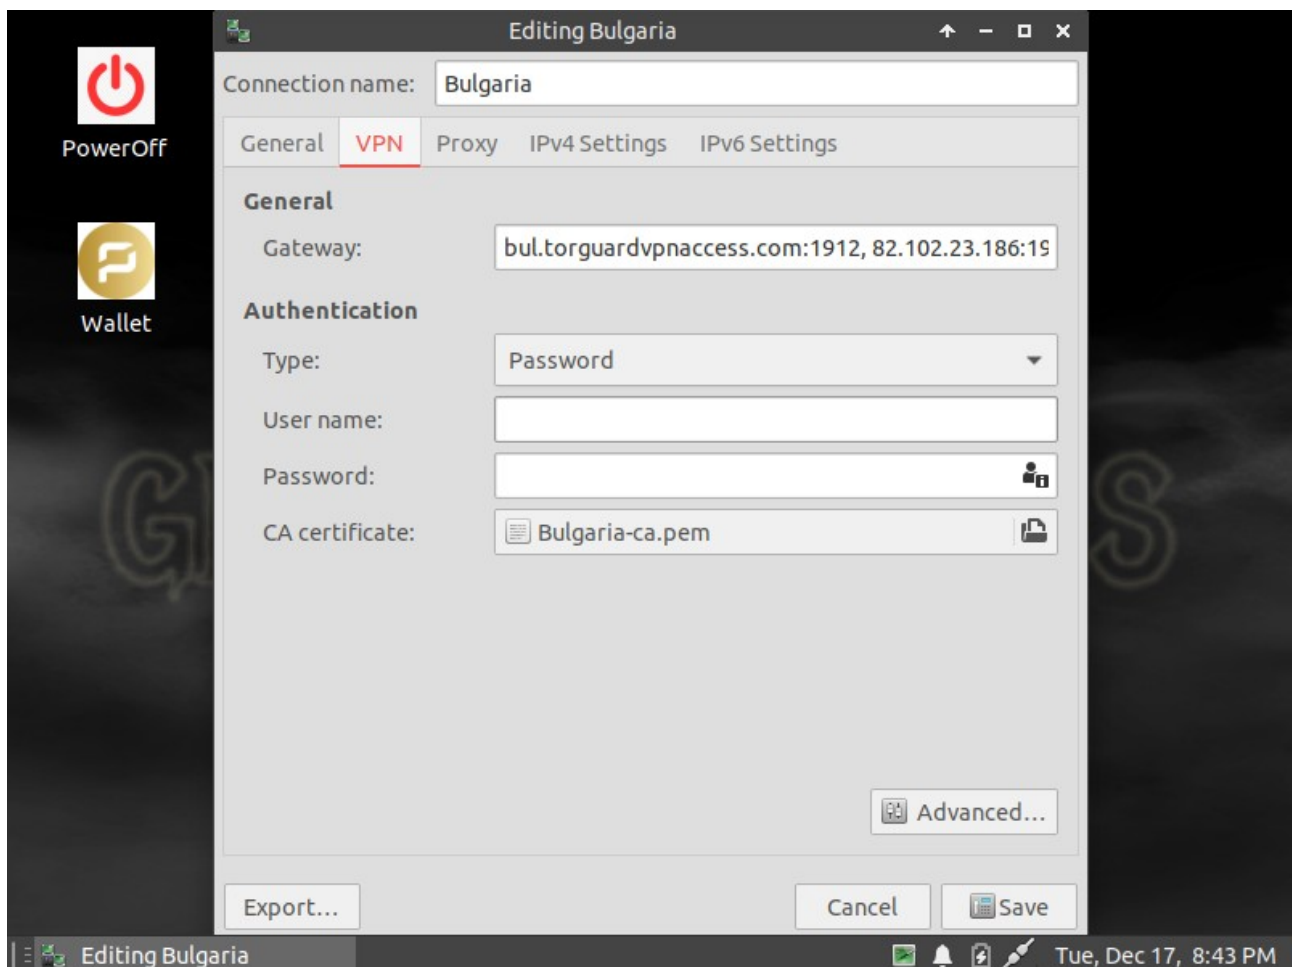

Connecting to VPN

To connect to the VPN you have to use the same applet.

You can import configuration for several VPN providers. I will add more and more configurations to pirateOS. To do it, press import VPN configuration and choose one from VPN folder.

Then, certificates will be imported from that file. You still have to login though using your username and your password to yyour VPN provider.

Maintance
To update PirateOS you have to download new one and burn it on the same USB.
It is temporaily solution. In the future pirateOS will keep update itself.
Dont worry, there wont be many significant updates.

Remeber your seed, it is your backup !!!
